# **DIV**—Unsigned Divide

Opcode	Instruction	64-Bit Mode	Compat/ Leg Mode	Description
F6 /6	DIV r/m8	Valid	Valid	Unsigned divide AX by $r/m8$ , with result stored in AL $\leftarrow$ Quotient, AH $\leftarrow$ Remainder.
REX + F6 /6	DIV r/m8 <sup>*</sup>	Valid	N.E.	Unsigned divide AX by $r/m8$ , with result stored in AL $\leftarrow$ Quotient, AH $\leftarrow$ Remainder.
F7 /6	DIV r/m16	Valid	Valid	Unsigned divide DX:AX by $r/m16$ , with result stored in AX $\leftarrow$ Quotient, DX $\leftarrow$ Remainder.
F7 /6	DIV r/m32	Valid	Valid	Unsigned divide EDX:EAX by $r/m32$ , with result stored in EAX $\leftarrow$ Quotient, EDX $\leftarrow$ Remainder.
REX.W + F7 /6	DIV r/m64	Valid	N.E.	Unsigned divide RDX:RAX by $r/m64$ , with result stored in RAX $\leftarrow$ Quotient, RDX $\leftarrow$ Remainder.

#### **NOTES:**

### **Description**

Divides unsigned the value in the AX, DX:AX, EDX:EAX, or RDX:RAX registers (dividend) by the source operand (divisor) and stores the result in the AX (AH:AL), DX:AX, EDX:EAX, or RDX:RAX registers. The source operand can be a general-purpose register or a memory location. The action of this instruction depends on the operand size (dividend/divisor). Division using 64-bit operand is available only in 64-bit mode.

Non-integral results are truncated (chopped) towards 0. The remainder is always less than the divisor in magnitude. Overflow is indicated with the #DE (divide error) exception rather than with the CF flag.

In 64-bit mode, the instruction's default operation size is 32 bits. Use of the REX.R prefix permits access to additional registers (R8-R15). Use of the REX.W prefix promotes operation to 64 bits. In 64-bit mode when REX.W is applied, the instruction divides the unsigned value in RDX:RAX by the source operand and stores the quotient in RAX, the remainder in RDX.

See the summary chart at the beginning of this section for encoding data and limits. See Table 3-28.

<sup>\*</sup> In 64-bit mode, r/m8 can not be encoded to access the following byte registers if a REX prefix is used: AH, BH, CH, DH.

Table 3-28. DIV Action

Operand Size	Dividend	Divisor	Quotient	Remainder	Maximum Quotient
Word/byte	AX	r/m8	AL	AH	255
Doubleword/word	DX:AX	r/m16	AX	DX	65,535
Quadword/doubleword	EDX:EAX	r/m32	EAX	EDX	2 <sup>32</sup> – 1
Doublequadword/ quadword	RDX:RAX	r/m64	RAX	RDX	2 <sup>64</sup> – 1

# **Operation**

```
IF SRC = 0
   THEN #DE; FI; (* Divide Error *)
IF OperandSize = 8 (* Word/Byte Operation *)
   THEN
        temp \leftarrow AX / SRC;
        IF temp > FFH
             THEN #DE; (* Divide error *)
             ELSE
                  AL \leftarrow temp;
                  AH \leftarrow AX MOD SRC;
        FI;
   ELSE IF OperandSize = 16 (* Doubleword/word operation *)
        THEN
             temp \leftarrow DX:AX / SRC;
             IF temp > FFFFH
                  THEN #DE; (* Divide error *)
             ELSE
                  AX \leftarrow temp;
                  DX \leftarrow DX:AX MOD SRC;
             FI;
        FI;
   ELSE IF Operandsize = 32 (* Quadword/doubleword operation *)
        THEN
             temp \leftarrow EDX:EAX / SRC;
             IF temp > FFFFFFFH
                  THEN #DE; (* Divide error *)
             ELSE
                  EAX \leftarrow temp;
                  EDX ← EDX:EAX MOD SRC;
             FI;
        FI;
```

```
ELSE IF 64-Bit Mode and Operandsize = 64 (* Doublequadword/quadword operation *)

THEN

temp ← RDX:RAX / SRC;

IF temp > FFFFFFFFFFFFFFFH

THEN #DE; (* Divide error *)

ELSE

RAX ← temp;

RDX ← RDX:RAX MOD SRC;

FI;

FI;
```

#### Flags Affected

The CF, OF, SF, ZF, AF, and PF flags are undefined.

### **Protected Mode Exceptions**

#DE If the source operand (divisor) is 0

If the quotient is too large for the designated register.

#GP(0) If a memory operand effective address is outside the CS, DS,

ES, FS, or GS segment limit.

If the DS, ES, FS, or GS register contains a NULL segment

selector.

#SS(0) If a memory operand effective address is outside the SS

segment limit.

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory

reference is made while the current privilege level is 3.

**#UD** If the LOCK prefix is used.

#### Real-Address Mode Exceptions

#DE If the source operand (divisor) is 0.

If the quotient is too large for the designated register.

#GP If a memory operand effective address is outside the CS, DS,

ES, FS, or GS segment limit.

If the DS, ES, FS, or GS register contains a NULL segment

selector.

#SS(0) If a memory operand effective address is outside the SS

segment limit.

#UD If the LOCK prefix is used.

## Virtual-8086 Mode Exceptions

#DE If the source operand (divisor) is 0.

If the quotient is too large for the designated register.

#GP(0) If a memory operand effective address is outside the CS, DS,

ES, FS, or GS segment limit.

#SS If a memory operand effective address is outside the SS

segment limit.

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory

reference is made.

#UD If the LOCK prefix is used.

#### **Compatibility Mode Exceptions**

Same exceptions as in protected mode.

## **64-Bit Mode Exceptions**

#SS(0) If a memory address referencing the SS segment is in a non-

canonical form.

#GP(0) If the memory address is in a non-canonical form.

#DE If the source operand (divisor) is 0

If the quotient is too large for the designated register.

#PF(fault-code) If a page fault occurs.

#AC(0) If alignment checking is enabled and an unaligned memory

reference is made while the current privilege level is 3.

**#UD** If the LOCK prefix is used.
